

## Amber20 update 12

### Webpage

<http://ambermd.org/>

### Version

Amber20 update 12, AmberTools 21 update 11

### Build Environment

- Intel Parallel Studio 2017 Update8 (MPI only)
- GCC 7.3.1 (devtoolset-7)
- CUDA 11.1 Update 1

### Files Required

- Amber20.tar.bz2
- AmberTools20.tar.bz2
- (Amber20 update.1-12 & AmberTools20 update.1-15 & AmberTools21 update.1-11; obtained in the script below)
- patch-nmrat-gpu.cpp
  - see <http://archive.ambermd.org/202110/0206.html> for details. no official update available, though.

## Tests

- Results are available in /local/apl/lx/amber20-up12/logs directory.
- Most of errors are simple (minor) numerical errors.
- there were two errors on "test\_at\_serial" test. it seems to be an issue about parmed python package.

## Notes

- if cmake is employed, pbsa\_cuda\_cg failed; the same error as previous build.
- miniforge was employed instead of miniconda
- Quick has a problem about shared library (probably libstdc++). We thus simply disabled Quick for now.
  - We didn't conduct a detailed analysis of this error yet.
- reaxff-puremd was tentatively enabled for OpenMP version.
- Python file paths are incorrect?
  - <https://github.com/Amber-MD/pdb4amber/issues/85#issuecomment-672812778>
  - At least, we can import parmed or pdb4amber packages with amber.python now.
- nmrat patch was not an official one....
  - applying the patch didn't harm test results.
- gcc8/gcc10 versions failed on tests involving EGB (as in the case of previous builds). We thus employed gcc7.
- -mkl is not harmful for OpenMP and MPI versions without GPU. We thus enabled MKL for those versions.
- PNetCDF was disabled by applying the patch above.
  - Otherwise, compilation of cpptraj.MPI would fail due to the requirement of PNetCDF.
- (June 1, 2022 update) bin/parmed and bin/pdb4amber didn't work due to the errors upon initialization.
  - These scripts were manually modified to the format like previous versions.
