

AMBER 24 update 3

Webpage

<http://ambermd.org/>

Version

Amber24 update 3, AmberTools 24 update 8

Build Environment

- GCC 13.1.1 (gcc-toolset-13)
- CUDA 12.4 update 1
- OpenMPI 4.1.8 (CUDA-aware)
- MKL 2025.0.0.1 (oneAPI 2025.0.1)
- (Gaussian 16 C.02; only for QM/MM test)

Files Required

- Amber24.tar.bz2
- AmberTools24.tar.bz2

Build Procedure

```
#!/bin/sh

VERSION=24
TOOLSVERSION=24

# amber24 upadte 3 + AmberTools24 update 8
INSTALL_DIR="/apl/amber/24u3"
WORKDIR="/gwork/users/${USER}/amber24"

make test.openmp && make clean.test

# serial tests
make test.serial && make clean.test

```

Tests

GPU version tests were performed on ccgpu (equipped with A30*2).

```
#!/bin/sh

INSTALL_DIR="/apl/amber/24u3"

#-----
module -s purge
module -s load gcc-toolset/13
module -s load openmpi/4.1.8/gcc13-cuda12.4u1
module -s load cuda/12.4u1
module -s load mkl/2025.0.0.1
module -s load gaussian/16c02

export LANG=C
export LC_ALL=C
ulimit -s unlimited

# run tests
cd ${INSTALL_DIR}
. ${INSTALL_DIR}/amber.sh

make clean.test

## gpu tests
export DO_PARALLEL="mpirun -np 2"
make test.cuda.parallel && make clean.test # DPFP
cd test; ./test_amber_cuda_parallel.sh SPFP; make clean; cd ../
#
unset DO_PARALLEL
make test.cuda.serial && make clean.test # DPFP
cd test; ./test_amber_cuda_serial.sh SPFP; make clean && cd ..
```

Test log files are available in /apl/amber/24u3/logs. The results are almost identical to [previous installation](#).

Notes

- Miniforge is officially used now. Therefore, patch file to replace miniconda with miniforge is no longer necessary.
- "update_amber" command failed with UnicodeDecodeError when python 3.6 (system default version) was employed. Python 3.9 (non-default version) was used only for update_amber.
- Parallel make (make -j) failed with missing file error of amber-modules/pmemd/gbl_constants_mod.mod. Serial make works fine.
- Libraries in miniforge are not correctly referenced? miniconda/lib was added to LD_LIBRARY_PATH in amber.*sh files. Otherwise, some of command do not work.
 - PYTHON_EXECUTABLE specification is necessary when miniconda is reused? ANACONDA_BIN no longer works.
 - (Mar 13 added) adding "miniconda/lib" to LD_LIBRARY_PATH causes the minor problem of module command, possibly due to tcsh8.6 and libtcsh8.6 files in amber24 miniforge. When executing commands such as "module list", "WARNING: terminal is not fully functional" message may appear. However, no further problems have been confirmed so far. (This problem does not occur for 24u1, since "miniconda/lib" does not exist in LD_LIBRARY_PATH.)
 - This problem may be solved by adding rpath setting to executables and libraries of amber and removing miniconda/lib from LD_LIBRARY_PATH. But it has not yet been tested.
 - (Apr 4) The library problem above was solved by changing LD_LIBRARY_PATH. There were no apparent problems in re-test of Amber/AmberTools.
